Our standard terms and conditions apply.

The PSE softstarter is the world's first compact softstarter with torque control and LCD display. It is developed in close cooperation with customers to ensure that the product fulfills their important needs. The PSE softstarter is ideal for any application where space is limited, but where advanced functionality is still required. It is suitable for all common applications such as pumps, fans, compressors, conveyor belts, and more.

Easy

One of the most important features of any electrical device is that it is easy to set-up and easy to use. The PSE softstarter is equipped with a language neutral backlit display and an easy-to-use four button keypad. In addition, the built-in by-pass provided in this compact unit reduces the number of connections, making it easy to mount and ultimately decreasing both time and cost of the installation.

Efficient

Knowing what the customers want has made it possible to design a softstarter that really fulfills their needs, without adding unwanted complexity. This gives excellent value for money and, together with the built-in by-pass for energy saving, makes the PSE softstarter a very efficient choice.

Reliable

The PSE softstarter is designed to ensure exceptional reliability, even in tough and harsh environments. Features such as torque control eliminates water hammering, and thereby, greatly reducing the mechanical stress on pump systems and provides a more reliable operation with less downtime.
