

City centre in-feed feasible by HVDC Light®

HVDC Light® is a state-of-the-art power system designed to transmit power underground and underwater. It offers numerous environmental benefits, such as “invisible” power lines, neutral electromagnetic fields, oil-free cables and compact converter stations. These benefits make new transmission projects in densely populated areas acceptable for the public.

Your needs – Our response

Utilities are under extreme pressure to meet consumer and regulatory demands for a high quality, competitively priced power supply that has low environmental impact.

A constraint in building transmission capacity in existing AC grids is the demands on compatibility to the environment along the transmission corridor and the extent to which the developments are acceptable to neighbouring communities.

Meeting these needs with underground HVDC transmission is not only economically feasible, but adds power quality benefits much in demand by today's power networks.

Customer Value

The HVDC Light Cross Sound Cable was energized overnight after the North American blackout in 2003. Millions of consumers in the New York area benefited from the quick network rebound. Beyond its black start capability, the system offers:

- AC grid enhancements
- Reliable power supply
- Black start capability
- Easier permit procedure
 - Underground invisible cable system
 - Environmental friendly oil-free cables
 - Short installation and implementation time
 - Environmentally adapted converter stations
- Low project risk by
 - Easy permitting
 - Short construction and commissioning time
 - Minimizing time from decision to commercial operation
- Flexible, modular systems
 - Can easily be built or expanded to multiterminal system
 - Modular systems can be staged and installed to meet capacity demand
 - Comprehensive factory testing and fast installation
 - Short installation and implementation time
- Underground invisible cable system
 - Enables installations in existing right of ways e.g. existing cable ducts, roads, subways, railways, channels
- Compact, environmentally adapted converter station design
 - Reduction of station foot-print
 - Lower costs for land and civil works
- Health Safety and Environment (HSE) impact
 - Twin cable installation neutralizes magnetic fields
 - Enclosed equipment gives efficient noise suppression
- Low operation and maintenance costs

City centres: high power demand, significant network constraints

Scope of supply

- Feasibility studies to facilitate customer's business development process, including optimization of the entire project/system
- System analysis and network studies
- Engineering and project management
- State of the art HVDC Light® technology including turnkey supply of
 - Converter stations with compact design, adapted to the environment
 - Light-weight, oil-free cables
- Quality assurance ensures the customer systems, operations, and maintenance staff receives proper training and documentation for a smooth transfer at Take Over
- Maintenance Support with short response thanks to remote diagnostics from supplier home base

ABB – pioneers of HVDC

ABB pioneered HVDC technology 50 years ago when the company built the world's first commercial high-voltage direct current transmission link in Sweden. Building on this world first, ABB has maintained its undisputed world leadership in HVDC transmission technology. We have supported our customers with more than 55 HVDC projects around the world providing more than 45, 000 MW of transmission capacity.

And since 1999, with its new HVDC Light® technology, ABB is once again building a technological lead with solutions to customers' transmission challenges around the world.

Continuing to meet these needs will maintain ABB's leadership position.
