

MPS Insight Mobile

Production tracking on mobile devices

MPS Insight Mobile brings live production tracking data to mobile devices like PDAs and mobile phones. Designed in cooperation with leading production managers for production managers, it provides executives on the move with an overview of essential production data.

The application, which can handle data from multiple print sites, runs on a web server and is accessed through a simple browser on the mobile device. The simple three-level hierarchy means that the required data is never more than two clicks away, and traffic light symbols give an immediate overview of the status of each process. Text messages give notification of more serious problems.

Secure access control ensures that only authorized persons can view the data.

The default page shows the list of processes covered together with the traffic light status. The ranges covered by each traffic light color can be configured on the web server.

One click on a process takes the user to an overview of that process. Another click shows details of a single product/edition/production/press etc.

- 1 Default page of MPS Insight Mobile showing the processes and traffic lights representing their status
- 2 Notification by text message of a problem
- 3 Details of a press production run

The hierarchy below the default page

Editorial – received pages Overview of the pages received and required per print product	Details Details of the pages for one print product
