

Industrial^{IT} takes you further in reaching your automation goals

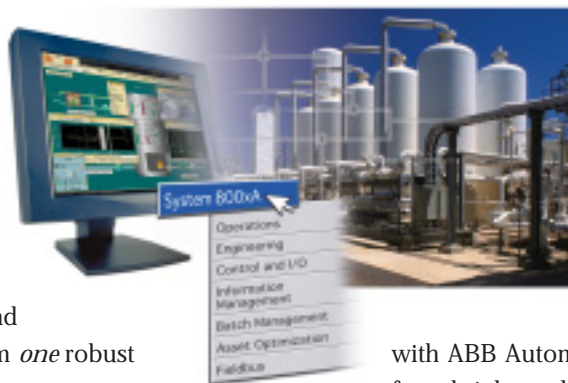

Expand your horizons with System 800xA *Extended* Automation

Only one automation system can really deliver on the promise of new heights in productivity and performance: The Industrial^{IT} Extended Automation System 800xA. It's the one system investment that comes with a ticket not just to process control but to the full range of plant automation tools in a single user environment. It will help your plant run smarter, better, and at lower cost.

System 800xA *extends* your plant management capabilities to the full realm of functions, including production management, safety, robotics, advanced control, information management, smart instrumentation, smart drives, motor control centers, asset optimization, and documentation. And it's all yours from *one* robust operations and engineering environment.

Our Operate^{IT} Process Portal user interface lets you personalize this extended view of your plant to focus on the specific needs of Operations, Engineering, Maintenance, and Management — so they can see and act

upon the right information at the right time. System 800xA keeps one consistent set of data for use throughout the plant—dramatically increasing your efficiency through reuse of your best practices and providing a single point of change for all system information. This makes you — and your operations — much more efficient!

If you already own one of ABB's forward-compatible DCS platforms, you have the flexibility of extending your automation reach by adding new System 800xA functions today – and the agility to add others as your needs grow. If you are not currently on-board

with ABB Automation, we can still help you reach for a brighter plant future without building from the ground up. Are you ready for an automation system that will do *more* to reach your goals?
